Several aspects of this interaction will be studied by examining the relative effects of adrenalectomy and hypophysectomy on ACTH secretion, the pattern of ACTH secretion in response to various stimuli, and in vitro hypothalamic regulation of the pituitary-adrenal axis. The degree of adrenal dependence of the response to vasopressin will be studied and the possibility that it functions as a "feedback" mechanism will be evaluated. The role of the pituitary in the regulation of sympathetic nervous system activity will be studied by examining the effect of hypophysectomy on pituitary-adrenal responsiveness to a beta-adrenergic stimulator and an antagonist. Finally, the possibility that neurohumoral factors in the brain exert an influence over the activity of the adrenal will be evaluated. These experiments are designed to test the hypothesis that the pituitary gland plays a major role in the integration and timing of the sympathetic 570a42141b
