The Game Visual Novel Maker is an RPG Maker Series plugin that provides RPG Maker VX Ace users with a way to create visual novels and CD-ROM text-based games. This plugin contains 20 of the greatest tracks from the JRPG and Fantasy Music Vol. 2 DLC pack by Sonancy Designs, perfect for classic RPG sonic landscapes that are stimulating as they are inspirational. The following list contains all the music tracks included in the JRPG and Fantasy Music Vol. 2 DLC pack by Sonancy Designs. The songs were chosen by Sonancy Designs from the original JRPG and Fantasy Music Vol. 2 pack, and have been carefully edited to be a better fit for a visual novel or RPG Maker game. They will work with practically any game engine including RPG Maker VX Ace, Monju, the RPG Maker game engine, and others. You are free to use the 20 songs in this pack as you see fit! Enjoy!

Spinal cord ependymal cells are the source of axons. The spinal cord of adult and larval sea lamprey (*Petromyzon marinus*) was examined to determine whether ependymal cells generate spinal cord axons. Anterograde transport of wheat germ agglutinin-horseradish peroxidase (WGA-HRP) from the ventral spinal cord after tracer application into the fourth ventricle revealed that dorsal (NR) ependymal cells send axons into the rostral tectum (NT) and the posterior tuberculum. Dorsal (NRP) ependymal cells send axons into the NT and the infundibular recess. These observations, together with previously reported cell lineage studies, suggest that ependymal cells contribute to the formation of multiple tract systems, including the trigeminal tract. In addition, ependymal cells located near the dorsal median septum may contribute to the formation of the dorsal longitudinal fascicle. These studies also suggest that ependymal cells can send axons into subpially localized regions of the caudal diencephalon. These studies provide the first evidence that ependymal cells are the source of spinal cord axons in a vertebrate.
