In order to work with images, you need to be able to open and view them in Photoshop. These two tasks are covered in the next section. ## Opening Files Photoshop doesn't automatically open images, so you must open them yourself. This process is similar to opening any other image file and can be done in many ways. You can open images in Photoshop by using either of the two file browsers: Windows Explorer or File Viewer. These apps are most likely on your computer and allow you to select the file type that you want to open. In addition to using Windows Explorer or File Viewer to open and view images, you can also open Photoshop from within other applications. For example, you can open a digital camera card or the memory card from your camera in Photoshop by using the Windows Explorer app. When you open an image in Photoshop, you get to work on that image only, with no other files available. When you close the image file, Photoshop saves any edits you did to the original file. ## Viewing Photos and Images Photoshop has a built-in standard viewing system so that you can see any images or photos that you open. As described in the preceding section, Photoshop's

file browser allows you to open and view different image file types. Here are some of the image file types that Photoshop can open and view: * **JPEG** (_.jpg_) A common type of digital photo file * **TIFF** (_.tiff_) A common type of digital photo file * **RLE** (_.rle_) A type of compressed image file that has one bit per pixel * **BMP** (_.bmp_) A type of Windows bitmap file When you open an image, Photoshop displays a familiar interface for you to work on the image. This section covers opening and viewing most common image types in Photoshop.

Dietary polyunsaturated fatty acids and the prevention of ischemic stroke. Numerous clinical studies and animal experiments indicate that low dietary intake of fatty acids (FAs) is associated with an increased risk of ischemic stroke. However, there is a lack of definitive human data and clinical studies and animal experiments have yielded conflicting results. Furthermore, emerging literature indicates that dietary FAs may not be as important as previously thought in ischemic stroke. Saturated FA (SFA) intake has been shown to be beneficial for the prevention of ischemic stroke. Dietary FAs are divided into SFA, monounsaturated FA (MUFA), and polyunsaturated FA (PUFA). The purpose of this review is to summarize the evidence from clinical studies and animal experiments that address the importance of the two FAs that make up dietary SFA, palmitic acid and stearic acid, in the prevention of ischemic stroke. Furthermore, this review addresses the role of the major dietary polyunsaturated FAs in the prevention of ischemic stroke. The present invention relates to a medical solid radiation detecting device and, more particularly, to a medical radiation detecting device for discriminating between a radiation dosage region receiving a radioactive ray and a dosage region not receiving the radioactive ray, in which the dose of the radioactive ray received by the dosage region is detected by a radiation detecting element having high efficiency for detecting the radioactive ray. In a conventional medical radiation detecting device of the type described, a number of radiation detecting elements for detecting an X-ray, a.beta.-ray, a.gamma.-ray, an.alpha.-ray, an Auger electron or the like, are arranged close to each other or arrayed along a predetermined direction and, as a result, when the X-ray,.gamma.-ray or the like is projected onto the arrayed radiation detecting elements, the X-ray,.gamma.-ray or the like is to be detected under the control of the radiation detecting elements which have detected radiation. In this connection, it should be noted that the aforesaid radiation detecting elements are, for example, silicon semiconductor devices, each having a semiconductor substrate of Si or the like in which a pn junction is formed, and that the radiation detecting elements are enclosed in a housing, or are arranged in a lead frame. FIG. 6 shows one example of the conventional radiation detecting device, in which a number of radiation detecting elements 4b, 4b'

Katharine Trumper Katharine Trumper (1880–1970) was a New Zealand weaver, teacher and art teacher. She was born in Te Aroha, New Zealand on 31 January 1880. In 1919, Trumper co-founded the Auckland Art School (now the University of Auckland Art School). In 1958, Trumper was made a chevalier of the French Legion of Honour. In a 2012 poll, Trumper was voted among the top 50 New Zealanders with the most influence. References Category:1880

Compression is generally needed for the storage of blood pressure (BP) recordings. However, blood pressure and heart rate appear to increase during the night, and common practice is to accept an increase in average recording quality. To determine the appropriate compression ratios when storing nocturnal BP recordings of sufficient quality for 24-hour recording. We evaluated 2211 nocturnal BP recordings obtained from 1203 patients who underwent 24-hour BP measurement from November 2001 to May 2003. The highest quality recordings, defined as including ≤2 BP readings per hour with no more than 1 missed value, were selected for analysis. We compared the systolic blood pressure (SBP) and diastolic blood pressure (DBP) levels in 80% and 100% quality recordings at various fixed compression ratios and evaluated the change in mean arterial pressure (MAP) and end-organ damage. The optimal compression ratios were 42:1 and 46:1 for SBP and DBP, respectively. When compression ratio increased from 32:1 to 46:1, the recorded SBP decreased from 122.3 to 119.6 mm Hg and DBP decreased from 73.4 to 72.1 mm Hg. MAP increased by 2.8 mm Hg, and pulse pressure increased by 2.5 mm Hg. The incidence of end-organ damage was comparable with that in a previous study. In conclusion, when the mean quality of recorded nocturnal SB
